**Abstract**

The pupal exuviae of *Mallochohelea termophila* (Spinelli) is redescribed, photographed and illustrated mainly based on the type-series. Pupae of the type-series were collected with forceps from a thermal stream and were attached to rocks about 200 m from the spring head, and pupae from Uruguay with a deeper in lotic and lentic environments. They were reared to adults in the laboratory. This is the first detailed pupal description of a species of *Mallochohelea* Wirth, and the first record of this species from Uruguay. Similarities and differences with the pupae of *Neobezzia* Wirth & Ratanaworabhan are provided.

Key words: Inmature, *Mallochohelea termophila*, redescription, Ceratopogonidae

**Resumen**

Se describe, fotografía e ilustra la exuvia pupal de *Mallochohelea termophila* (Spinelli), en especial sobre la base de la serie-tipo. Las pupas de la serie-tipo fueron colectadas...
mediante pinzas en un arroyo termal, adheridas a rocas, aproximadamente a 200 m del manatíal, y las pupas de Uruguay mediante el uso de un cucharón tanto en ambientes lóticos como lenticos. Ellas fueron criadas hasta adultos en el laboratorio. Esta es la primera descripción detallada de una pupa de una especie de *Mallochohelea*, y el primer registro de la especie para Uruguay. Se destacan semejanzas y diferencias con las pupas de *Neobezzia* Wirth & Ratanaworabhan.

**Introduction**

The worldwide genus *Mallochohelea* Wirth belongs to the tribe Sphaeromiini, and it is represented in the Neotropical region by six species (Borkent & Spinelli, 2007). Five of these are known only from Brazil, Guyana, northern Argentina and Uruguay. *Mallochohelea pullata* (Wirth) ranges from the U.S.A. (California, Arizona and Texas) south to Brazil (Amapa).

The immatures stages of the genus are poorly known, being described the pupae of 12 named species and 2 unnamed ones (Borkent, pers. comm.). The descriptions of the known pupae, as well as the ones in other Sphaeromiini genera are very incomplete and superficial. With regard to the Neotropical species of *Mallochohelea*, only the pupa of *M. termophila* (Spinelli), a species known from the Amazon area of Rondonia in Brazil and northern Argentina, has been previously described (Spinelli, 1984).

The purpose of this paper is to make the first steps towards the improvement of the scarce current knowledge on the morphology of the Sphaeromiini pupae, by fully describing the pupa of *M. termophila* from the type-series, as well as from specimens subsequently collected in Uruguay.
Material and methods

Pupae of the type-series of *Mallochohelea termophila* were collected with forceps from a thermal stream, attached to rocks by their glandular windows on abdominal segments 6 and 7. They were located about 200 m from the spring head where the water temperature was 28°C and the PH 7.2. The pupae from Uruguay were collected with a deeper in both, lentic and lotic environments. In all cases, the pupae were transported to the laboratory individually in vials with a drop of water. Observations were made daily until adult emergence. Adults were allowed to harden for 24 hours before being preserved to ensure their pigmentation was complete. Pupal exuviae were examined using a binocular compound microscope (BCM) after being slide-mounted dorsoventrally in Canada balsam following the technique described by Wirth & Marston (1968). Ink illustrations were made with a camera lucida. Photomicrographs were taken with a Micrometric digital camera through a NIKON (10X or 40X). Terminology of the pupa follows Borkent & Craig (2001).

Description

*Mallochohelea termophila* (Spinelli) (Figs. 1-21)

*Neobezzia termophila* Spinelli, 1984: 197 (female, male, pupa; Argentina).

*Mallochohelea termophila*: Spinelli & Wirth, 1993: 58 (combination; in list of Argentinean species); Borkent & Wirth, 1997: 120 (in world catalog); Borkent & Spinelli, 2000: 58 (in catalog of species south of USA); Borkent & Spinelli, 2007: 91 (in Neotropical catalog); Borkent, 2011: 147 (online catalog).

*Male pupa.* Exuviae brown (Fig. 1). Operculum (Figs. 11, 17) with disc wider than long, OL 0.12-0.15 (0.13, n=2) mm, OW 0.17-0.20 (0.18, n=2) mm, OW/OL 0.70-0.75
(0.72, n = 2); anterior margin pointed, surface covered with small, rounded tubercles; each side of mesal portion with pair of raised areas, ventral one blunt, with anteromarginal seta long, thin, dorsal one with large pore. Two stout ventromedian setae (Figs. 9, 19), one medium-sized, other short; two elongate ventrolateral setae thinner than vm, lateral pore present (Figs. 9, 19). Respiratory organ (Figs. 1-2, 7, 16) relatively short, broad, 3 times longer than broad, RO length 0.10-0.12 (0.11, n = 3) mm, RO width 0.030-0.036 (0.033, n = 3) mm, surface smooth, apex with 8-10 spiracles in two rows; pedicel (P) short, stout (Figs. 2, 7, 10, 12), pedicel length 0.010-0.012 (0.011, n = 3) mm, P/RO 0.1 (n = 3). Cephalothorax (Fig. 2) length 1.22 mm, width 0.80 mm; medial longitudinal crest small, crenulate, extending between bases of respiratory organs; cephalothoracic setae as follows: two anterodorsal sensilla (Figs. 8, 16), one peg, other pore; one medium-sized, stout dorsolateral seta (Figs. 8, 16); two dorsomedian setae (Figs. 8, 16), one long, thin, other spur, pore present; six dorsal setae (Figs. 10, 18) on rounded tubercles: i-iii pegs, iv medium-sized, thin, v-vi pores. Abdominal segments covered with small pointed spicules, each segment with small pigmented anterolateral spiracular scar. Abdominal tergites 1-7 with d.a.s.m. i on rounded tubercle, d.p.m. i on short, sclerotized tubercle, each of these tubercles arising directly from surrounding cuticle, pore below dasm i and ii. First abdominal segment (Figs. 1, 20) with sensilla as follows: three anterior setae, i short stout seta, ii medium-sized, thin, seta, iii pore on mesal portion; four posterior setae: i minute, ii pore, iii peg, iv, long, thin setae; four lateral sensilla: one long thin seta, other short seta, other peg, remaining pore. Fourth abdominal segment (Figs. 1, 3, 21) with two dorsal anterosubmarginal setae, one pore: i, medium-sized, thin seta, ii long, thin seta, iii pore; four dorsal posteromarginal setae, one pore: i, iv peg, ii absent, iii pore, v long, thin seta; one lateral anterosubmarginal seta, long, thin on strong triangular tubercle; three
lateral posteromarginal setae: i, short, thin seta on stout triangular tubercle with minute spines, ii long, thin seta on small base, iii minute seta on small base; three ventral posteromarginal setae, i medium-sized, thin, ii long, thin, iii thin, shorter than i, i-ii on small tubercles; iii on well developed, stout, bifid tubercle. Abdominal sternites 6, 7, each with large disc like glandular areas. Anal segment (Figs. 1, 5-6) twice longer than greatest width, ASL 0.37-0.39 (0.38, n = 3) mm, ASW 0.16-0.21 (0.19, n = 3) mm; lateral margins convex, ventral surface with abundant small spicules, posteriorly directed tubercles not extending to base of apicolateral processes. Apicolateral process (Figs. 1, 5) stout, curved, divergent, with pointed spicules, base broad, one ventral pore on base, tip pointed, length 0.22 (n = 2) mm.

Female pupa. Similar to male with sexual differences: Total length 4.27 mm.

Operculum (Figs. 12-13) with triangular disc, anterior end very pointed; OL 0.12 mm (n = 5); OW 0.20-0.21 (0.204, n = 5) mm; OW/OL 1.70-1.75 (1.72, n = 5). Respiratory organ (Fig. 12) length 0.10-0.13 (0.12, n = 5) mm; width 0.036-0.043 (0.038, n = 5) mm; pedicel (Fig. 12) length 0.010-0.12 (0.011, n = 5) mm; P/RO 0.080-0.100 (0.096, n = 5). Cephalothorax (Fig. 12) length 1.41-1.58 (1.48, n = 5) mm, width 0.90 (n = 4) mm; ventral setae slightly shorter than male (Fig. 14). Anal segment (Fig. 15) sharply pointed, with pointed spinules, ASL 0.38-0.43 (0.39, n=5) mm, ASW 0.20-0.26 (0.24, n=5) mm, APL 0.22-0.24 (0.236, n=5) mm.

Taxonomic summary

Distribution. Brazil (Rondonia), Uruguay, northern Argentina.

Specimens examined. Argentina, Jujuy, Caimancito, 12-VIII-1980, E. Domizi-G. Spinelli, 1 male, 5 female paratypes; Uruguay, Artigas, arroyo Lenguazo and ruta nacional 3, 8-XI-1985, E. Balseiro-G. Spinelli, 1 male; Uruguay, Artigas, Cañada de
Cousillas, 20-IV-1985, G. Spinelli, 1 male. All specimens were collected as pupae and reared in the laboratory, and are deposited in the collection of the Museo de La Plata, Argentina (MLPA).

**Discussion.** The pupa of *Mallochohelea termophila* is similar to the known pupae of the genus *Neobezzia* Wirth & Ratanaworabhan. Both genera have the abdominal tergites 1-7 with d.a.s.m. i and d.p.m. i on short sclerotized tubercles, and the fourth abdominal sternite with v.p.m. iii on a bifid tubercle. However, the pupae of *Neobezzia* have a triangular operculum, 13 spiracles on the respiratory organ, the vm and vl are distinctly stronger and longer, and the l.a.s.m., v.p.m. and d.p.m. v are represented by longer setae.

The only other Neotropical pupa of the tribe Sphaeromiini is the one of *Nilobezzia schwarzii* (Coquillett), but the later species exhibits prominent, conical and pointed abdominal tubercles, and the large disc like glandular areas are present on the abdominal sternites 5, 6, and 7 (Wirth, 1962). Moreover, Elson-Harris (1990) pointed out that the Australian pupae of *Nilobezzia* Wirth show a shorter caudal segment and the bases of l.p.m. i and ii are clearly separated.

**Acknowledgments**

We acknowledge Dr. Art Borkent for his kindness in sharing with us part of an unpublished study of Ceratopogonidae pupae, as well as for the detailed review of the manuscript. Our gratitude also goes to Nélida Caligaris for technical assistance in the laboratory.
